

POSSE 8

AT A GLANCE

Powered by POSSE

POSSE 8 equips your organization with leading edge technology, enabling easier configuration, more transparency, and greater enhancement options. POSSE 8 is a version upgrade with several significant technology changes, including:

- Python 3 (required)
- Data Mart/Corral (required)
- POSSE IDs (optional)
- Scheduler/Process Server (parallel)

Configuration Reuse

Configuration reuse can be applied within the same database for repeatable units of work (shared by different parts of the system). This empowers technical specialists to upgrade business components on a selective basis within their business areas.

Consolidated Security

Unlike traditional database-centric security models that use disparate processing, POSSE 8's consolidated security model uses a business focused, multi-tier model that is scalable, transparent, and deterministic.

Working at the business level (not details), POSSE 8's consolidated security establishes the concept of ownership for information groups, affording simplified security setup with business terminology and grouping. This reduces effort across-the-board as the owned information is in lockstep.

Platform Extensibility

POSSE 8 **Rest APIs** expand the utility and extensibility of your 'Powered by POSSE' solution. Providing configurable business-centric APIs and web services for business integrations along with support for third-party data marts & data warehouses, POSSE 8 empowers business users to easily expand the scope of your POSSE solution and services.

Business Control

POSSE 8 provides you with more control than ever over your information access (private or public), authorization management, business area permissions, instance security, and external self-management. Configurable in a single location and applied throughout, each vendor, company, or contractor, can access their information only, with modularization equipping clear separation of business area configuration and management.

- ✓ Reusable business components
- ✓ Improved security configuration and transparency
- ✓ Configured business interfaces
- ✓ Modern data synchronization
- ✓ Improved scalability
- ✓ Current versions of third-party software
- ✓ XtraReports Query Builder user interface for business users
- ✓ New events model with full middle-tier processing
- ✓ POSSE Scheduler with workflow and post completion scripts
- ✓ Audit source
- ✓ Job lockdown
- ✓ Consolidated cross references
- ✓ Accessibility updates
